Contents

1 Preparation

1.1 Setting the target directory

We need to set our output path, this is found in the beginning of the script under the commented *Save location:*

Default   It is set to create a folder *Result* and populate him with the files.

2 Running the script

Just run it using the command *node GetTop500.js* and wait till the end.

3 Result

The script creates a directory with a txt file for each country available on the alexa topsites by country, and populates them with the top 500 most viewed urls.
